Before You Start

A little consideration in advance can save a lot of heartache later.

Before you do anything with Windows Vista, it's a good idea to spend a few minutes thinking carefully about which version you need. And one of the best tools available for doing just that is the Windows Vista Upgrade Advisor, which you can download free from Microsoft at www.microsoft.com/windowsvista. This simple tool will check your computer and give you a clear idea

of which versions will run on your PC. That way you won't have to worry about bringing home an edition that's too powerful for your PC.

For most people with a newer (less than two years old) desktop computer, compatibility isn't likely to be a big factor, and there's no reason most newer machines can't run Windows Vista beautifully. The main thing, generally, is to

make sure you've got a discreet graphics card, rather than one that's integrated directly into the motherboard. Upgrade Advisor can clear this up for you without question.

Once you know which versions will run on your PC, all that's left is to decide which version you really want. Use our handy chart to pick the best version for your needs.

Which edition is right for me?

Follow the chart below to discover which Windows Vista you should buy
